# AI Storyteller for Endangered Languages (Tulu & Awadhi)

## Team Details

Team Lead: Santhoshi

Team Members:

- Pavani

- Narasimha Naidu

- Jaswant

## Introduction

Many small languages are slowly disappearing because young people use big languages like English or Hindi. Tulu and Awadhi are two such languages. Storytelling tradition is fading, and digital tools do not support them. This project creates an AI storyteller to keep these languages alive through stories.

## Objectives

- Create stories in Tulu and Awadhi using AI.
- Use local culture, proverbs, and morals in stories.
- Read the stories with native accents using TTS.
- Give young people a fun way to connect with their culture.

## Problem Statement

Endangered languages have very little space in digital platforms. Most tools only support common languages. This causes cultural loss for communities.

## Proposed Solution

- AI system takes a theme (e.g., 'festival').
- Generates a folk-style story in Tulu or Awadhi.
- Adds cultural sayings and morals.
- Converts story into speech with native accent.
- Gives both text and audio output.

## Features

- Generate stories based on user's theme.
- Cultural touch with idioms and moral lessons.
- TTS narration in native accent.
- Both text + audio versions available.
- Can be extended to other languages.

## Technology Stack

- Frontend: React.js / Streamlit.
- Backend: Python (Flask / FastAPI).
- Database: MongoDB / PostgreSQL.
- AI Models: mT5 for text, TTS models for speech.
- Tools: GitHub, Figma.

## System Design

User → Theme input → Story generation → Cultural template → TTS narration → Output (Text + Audio).

## Implementation Steps

1. Collect folk stories.
2. Fine-tune mT5 model.
3. Create cultural templates.
4. Train TTS for accents.
5. Build Flask/React app.
6. Combine text + audio.

## Challenges

- Few datasets available for Tulu & Awadhi.
- Keeping stories authentic.
- Making TTS sound natural.
- Balance between AI creativity and culture.

## Results

- Input: Theme (e.g., 'festival of lights').
- Output: Folk story in Tulu/Awadhi + audio narration with native accent.

## Future Scope

- Add more endangered languages.
- Multi-speaker TTS.
- Open-source folk story archive.
- Use in schools for children.

## Conclusion

This project uses AI + culture + speech to keep endangered languages alive. By telling folk stories in Tulu and Awadhi, younger people can connect with tradition and heritage in the digital world.
